Holy War David Anderson 2004-07 Holy War The Blood of Abraham: Echoes from Nag Hammadi saying to all three Religions I am not the God you think you know is a book about the 1945 discovery at Nag Hammadi and how in time it will alter the future of Christianity-as well as Judaism and Islam. Through the lens of this discovery it addresses two important questions: · What is the role of the religions of Abraham in present world conflict? · Is only Islam to blame, or also Judaism and Christianity? It exposes the underlying flaws that are built into each of these three religious belief systems and, although it leaves it to the reader to decide, argues that culpability for Islamic terrorism lies not only with the failures of Islam, but also with the failures of Judaism and Christianity. It is a book that calls on its readers; Christians, Jews and Muslims, and all others, to look within themselves in search for answers to the most important questions facing our world today.

Great Medical Discovery L. H. Bryan 2018-09-25 Excerpt from *Great Medical Discovery: The Blood Poison, Its Origin and Nature, and How It Acts Upon the System to Cause the Many and Varied Diseases That Afflict Mankind, and Its Antidote* When we contemplate the admirable structure and nicely balanced arrangements of the human body, its delicate form, the number and exquisite fineness Of its movements, it cannot be a matter of surprise that it should so Often be the subject of disease; especially when we reflect on the numerous ills to which it is daily and hourly exposed, as well from external causes, as from its own organization. The general system comprehends within itself many subordinate systems, the proper functions of

which must all conspire and harmonize to form perfect health. And the constitution Of our frame is such 'that no one part Of importance can be materially disordered without reacting on other parts, which in their turn give rise to a series of altered actions, and thus the whole system is finally drawn into morbid consent. History of the Discovery of the Circulation of the Blood (Classic Reprint) Henry Cadwalader Chapman 2016-06-23 Excerpt from History of the Discovery of the Circulation of the Blood The name of Herophilus ought to be familiar to all students of anatomy, as many parts of the human body, such as the Choroid Plexus, the Torcular Herophili, the Calamus Scripto rius, the Duodenum, etc., were first described by him. The most important contribution that he made to our knowledge of the vascular system was the demonstration of the isochronism of the pulsations of the arteries and of the beating of the heart, and of the latter being the cause of the former, a phenomena that had already been imperfectly referred to by Hippocrates and Aris tole. Herophilus noticed also the difference in the thickness of the walls of the arteries and of the veins, and described the vessels connecting the heart and the lungs, distinguishing the pul monary artery from the pulmonary vein, designating the former as the arterial vein and the latter as the venous artery. A History of the Discovery of the Circulation of the Blood (Classic Reprint) P. Flourens 2018-01-08 Excerpt from A History of the Discovery of the Circulation of the Blood A desire for information in regard to the history of a science, as naturally follows its study as does the wish to know something of the countries through which we travel, or of the biography of authors whose works have instructed or amused us. To medical men the satisfaction of this desire is attend ed with something more than the mere gratification of curiosity; lessons of great practical

value are to be derived from the study of the history of medicine. As we observe the slow and uncertain manner in which our present knowledge has been attained, we shall feel that our progress is likely also to be gradual, and that the great discoveries of the future are to be made, like those of the past, by patient and long continued observation, judicious experiment and careful generalization. As we see the doctrines of great teachers, which were received by their followers as infallible, shown one after the other to be erroneous, we may learn caution in regard to resting our efforts with the present attainments of science. For these and many other reasons the study of the history of medicine is valuable to the practitioner, and has always been recommended to the student, by those best qualified to judge, as an important part of his professional education. An Anatomical Dissertation Upon the Movement of the Heart, and Blood in Animals William Harvey 2017-12-04 Excerpt from An Anatomical Dissertation Upon the Movement of the Heart, and Blood in Animals: Being a Statement of the Discovery of the Circulation of the Blood Doctor harvey's work De Motu Cordis, ' setting forth his discovery, was on its publication, as is well known, generally rejected but it is not perhaps generally recollected that no ocular demonstration of the actual Circulation of the Blood was possible at that time; nor until the introduction of the microscope which was not till after his time. In this consists doctor harvey's true greatness that he arrived at his discovery by faith in inductive reasoning as an infallible guide to Truth. He was indeed a true Seer and his discovery is the most beneficial to mankind that has yet been made. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. William Harvey; a History of the Discovery of the Circulation of the Blood Robert Willis 2013-09 This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1878 edition. Excerpt: ... CHAPTER III. RECENT HISTORIANS OF THE DISCOVERY OF THE CIRCULATION OF THE BLOOD. My work would be incomplete were I not to conclude with a notice of some at least of my predecessors, historians of the Circulation, critics and advocates of one or another to whom the discovery has been ascribed. In exposing the views of the great anatomists of former times from their works, I have referred incidentally oftener than once to recent writers who believe that in these they detect a knowledge more or less complete of the Circulation. Among the most persistent of all in his advocacy of the claims of Hippocrates to such distinction is Jo. Ant. van der Linden, professor of medicine in the University of Leyden. In a series of no fewer than twenty-seven dissertations published under the names of his students on taking their medical degrees, ¹ he has brought together and given his own interpretation to every passage in the writings of the Father of Physic which he thinks bears upon the question in 1 Jo. Ant. van der Linden. Hippocrates. de Circuitu Sanguinis, Dissertationes xxvii. Lugd. Batav., 1659-63. 4to. hand. But I have said enough under the head of Hippocrates on the learned professor's lucubrations to make it unnecessary for me to take up the subject at any length in this place. I only add, that Van der Linden is totally opposed to Harvey's title to be accounted the discoverer of the Circulation of the Blood. Advocate as he is of Hippocrates, however, he would not have him enriched to the extent of making every one who came after him his debtor. Harvey had not to go so far back as the days of the Coan Sage for his knowledge. Van der Linden informs us seriously, that " he had been told by the learned Dr. Nicholas Oudart that he--Oudart--remembers...

William Harvey and the Discovery of the Circulation of the Blood Thomas Henry Huxley 2020-03-16 During his medical career, Harvey focused much of his research on the mechanics of blood flow in the human body. Most physicians of the 17th-century considered lungs responsible for moving the blood throughout the body. Harvey's famous "Exercitatio Anatomica de Motu Cordis et Sanguinis in Animalibus" commonly was published in Latin at Frankfurt in 1628. At that time, Harvey was 50 years old. The first English translation appeared two decades later. Observing the functioning of the heart in living animals, he was able to see that systole was the active phase of the heart's movement, pumping out the blood by its muscular contraction. Then he saw that the valves in the veins permit the blood to flow only in the direction of the heart and to prove that the blood circulated around the body and returned to the heart.

Epitope Recognition Since Landsteiner's Discovery M. Eibl 2012-12-06 Karl Landsteiner is best known for his discovery of the human blood groups. The revolutionary discoveries of this brilliant scientist in other fields have not received the recognition they deserve. His demonstration that poliomyelitis is transmissible showed the way of modern virology. His studies opening the field for epitope recognition, which he himself considered his main achievement, laid the foundation for research ongoing in our days. This book with its outstanding contributors is but a small tribute to this visionary scientist.

Blood Moons Rising Mark Hitchcock 2014-03-21 Has the final countdown to the end days begun? Are the heavens telling us we are nearing the end? Astronomers have noticed it is coming. Historians have noted its significance. In 2014 and 2015, there will be a phenomenon in the skies of four blood moons falling during Jewish feasts. This has only happened three times in recorded history: 1493-94, 1949-50 and

1967-68. Each time these dates have had extraordinary significance for the Israelites. From the discovery of the New World to the creation of modern-day Israel, these years of the four blood moons have truly been turning points in history. Bible prophecy describes the moon being darkened and turned to blood. What is the significance of these signs in the skies? What will the future bring? Prophecy expert Mark Hitchcock guides you through the relevant Bible passages so you can understand the times in which you live.
